

Intelligent Information Understanding & Processing

— UNDERSTAND THE PROBLEM

Context

Organizations handle large amounts of documents, reports, forms, records, messages, and other information. This information may come in different formats and structures, and people often need to manually review, organize, compare, and interpret it. Important details can be difficult to discover, understand, or connect across different sources.

Problem

Information is often spread across multiple sources and formats, making it difficult to identify what is important, understand the content quickly, compare information, and use it effectively. Manual handling can lead to overlooked details, repeated effort, delays, and inconsistent understanding.

Objective

Understand the difficulties people face when receiving, processing, understanding, and using information, and develop a software solution that improves the way information is handled.

Target Users

- People who regularly search, read, compare, or use information.
- Operations teams handling large volumes of information.
- Administrative teams managing documents, records, and communication.
- People who need to make decisions or take action based on information.

Intelligent Information Understanding & Processing

— EMPATHY & USER NEEDS

Information Users

- Find relevant information without reviewing everything manually.
- Understand information quickly and clearly.
- Identify important details that require attention.
- Compare information from different sources.
- Avoid missing useful or critical information.
- Use information with greater confidence.

Operations & Administrative Teams

- Handle large volumes of information more efficiently.
- Reduce repetitive review and organization work.
- Find required information without unnecessary searching.
- Identify important, incomplete, or conflicting information.
- Reduce delays caused by manual information handling.
- Maintain more consistent understanding across information sources.

Common Pain Points

- Large volumes of information.
- Different formats and structures.
- Information distributed across multiple sources.
- Repetitive manual review.
- Difficulty finding and comparing relevant information.
- Important details being overlooked.
- Delays caused by manual processing.
- Repeated effort and inconsistent understanding.

Intelligent Information Understanding & Processing

BUILD A BETTER INFORMATION EXPERIENCE

Develop software to help people handle information more easily and effectively.

Think about the information journey:

Think About

- How can people find the information that matters to them?
- How can important details be identified more easily?
- How can information from different sources be understood together?
- How can repetitive information-handling work be reduced?
- How can people move from information to action more easily?
- How can the solution remain simple as the volume of information grows?
- The goal is not to automate everything. The goal is to solve a real information-handling problem in a useful way.

Your Approach

Decide what your product should do, who it should help, and how people should interact with it. The technology, features, and implementation approach are open.

Build something that makes working with information easier.
